

LSM3259 Creative Assignment  
Chloe Ang Size Yun

**Figure 1.** Annotated photo of a crocheted model of *Stropharia caerulea*.

For my creative assignment, I crocheted a 3D model of a *Stropharia caerulea*, commonly known as the Blue Roundhead mushroom. I chose to crochet because I knew how to, and most importantly, it allows others to examine the different parts of a fungi from different angles, almost like they are examining the actual fungi. The model features a bright blue cap with white spots near the edges, a white stipe with a veil, and white gills underneath the cap, and a volva (Figure 1). The 3D features were made to represent the key features of a basidiomycota as accurately as possible.

The shape and construction of each crocheted component were intentionally designed to mimic the real features of the fungi. For example, the cap was crocheted in a concave, dome-like form to resemble the natural pileus of the fungus. The underside of the cap has crocheted parts that look like lines parallel to one another to represent the gills, which are the structures where spores are produced. The stem was made cylindrical to replicate the stipe that supports the cap, while an additional layer was in the middle of the stipe to represent the veil that protected the gills when the fungus was young. The small white spots near the edge of the cap were also included to imitate remnants of the veil that can remain on the cap surface.
