

Fungi in Singapore

Joan Tan Ting Li

Many in Singapore suffer from ‘fungi blindness’ - a state where one is unable to identify or differentiate between fungi, stemming from a lack of knowledge about them. This observation serves as my inspiration for this exhibit, which aims to introduce viewers to several fungi one might encounter in Singapore. As a bonus, the final section on cultivated mushrooms has also been included to make my project more relatable to the layman. Through this, the exhibit seeks to offer an accessible entry point into appreciating the broader diversity of fungi.

The exhibit consists of two main components: clay models and an accompanying book. The clay models provide a sense of realism, allowing viewers to visualise the morphology of these fungi, understand their natural growth forms and habitats, and engage with them more interactively (e.g., by observing features such as their undersides). The accompanying book complements these models by offering an introduction to fungi, identification tips, fun facts, and photographs of the actual fungi in their natural environments.
